COUNTERFEIT PRODUCTS STATEMENT

Counterfeit products are abundant in today’s world. It is everyone’s responsibility to be sure that counterfeit “fake” products are not installed during product development and production.

Harm to Business and Consumers
For consumers, product safety must always be the top priority. Counterfeit products do not meet international certification standards and their production lacks quality control management. Every electronic and electrical product either contributes to this safety goal, or detracts from it. At Moujen we strive to be a world class supplier and to contribute to making your end product the best it can be.

- Counterfeit products are made from cheap and often times unsafe materials, such as combustible materials or poor electroplating techniques.
- Counterfeit products generally imitate the appearance of a genuine product, but fail to back up the product specifications with any scientific or technological content.
- Production costs of counterfeit products are typically quite low compared to genuine products because there are no quality and safety standards to meet...low price is all that matters.
- Counterfeit products have resulted in serious harm to consumers health and safety as well as to industry. As a result, you will find very few instances where fraudulent products are backed with product liability insurance.
- Counterfeitters’ often infringe on registered patents, trade marks, logos, and agency approvals.

Harm to Society
There are numerous problems associated with the production of counterfeit products. These can include such concerns as:

- Lack of safety certifications
- Poor working conditions for those manufacturing counterfeits
- Unspecified product development and lack of a complete understanding of how genuine version of product is designed to be used
- Typically lower wages paid for the production of counterfeit products as compared to genuine products
